## 1. Important Safety Instructions

When using an EFKA drive and accompanying devices (e.g. for sewing machines), basic safety precautions should always be followed, including the following:

- Read all instructions thoroughly before using this drive.
  - Drive, its accessories and accompanying devices should be mounted and put into operation by qualified personnel in accordance with the guidelines provided in the instruction manual.
- To reduce the risk of burns, fire, electric shock, or personal injury:**
- Use this drive only for its intended use as described in the instruction manual.
  - Use only attachments recommended by the manufacturer or as contained in the instruction manual.
  - Do not operate without corresponding protective devices.
  - Never operate this drive if one or more parts (e.g. cables, plugs) are damaged, if it is not working properly, if any damages can be identified or are to be suspected (e.g. after it has been dropped). Only qualified personnel are authorized to make adjustments, eliminate faults and complete repair work.
  - Never operate the drive with the air openings blocked. Keep ventilation openings of the drive free from the accumulation of lint, dust and loose cloth.
  - Never drop or insert any object into any opening.
  - Do not use drive outdoors.
  - Do not operate where aerosol (spray) products are being used or where oxygen is being administered.
  - To disconnect, turn off main switch, then remove plug from outlet.
  - Do not unplug by pulling on cord. To unplug, grasp the plug, not the cord.
  - Keep fingers away from all moving machine parts. Special care is required e.g. around the sewing machine needle and the V-belt.
  - Before mounting and adjusting accompanying devices, i.e. position transmitter, reversing device, light barrier, etc., disconnect drive from mains (turn off main switch, remove mains plug from outlet [DIN VDE 0113 part 301; EN 60204-3-1; IEC 204-3-1]).
  - Always switch off (0) machine and remove plug from outlet, when removing covers, mounting accompanying devices, position transmitter especially, light barrier, etc., or any other devices mentioned in the instruction manual.
  - Only qualified personnel are authorized to work on the electrical components.
- Work on high voltage circuit areas is forbidden, except as stated in the respective regulations, e.g. DIN VDE 0105 part 1.
  - Only specially trained personnel are authorized to complete repair work.
  - Cables to be wired must be protected against expectable strain and fastened adequately.
  - Cables near moving machine parts (e.g. V-belts) must be wired at a minimum distance of 25 mm (see DIN VDE 0113 part 301; EN 60204-3-1; IEC 204-3-1).
  - For safety it is preferred to wire the cables separately from each other.
  - Before connecting the mains line make sure that the mains voltage corresponds to the specifications on the motor rating plate and on the nameplate of the power pack.
  - Connect this drive to a properly grounded outlet only. See Grounding Instructions.
  - Electric accompanying devices and accessories must only be connected to safety low voltage.
  - EFKA DC drives are protected according to overvoltage class 2 (DIN VDE 0160 § 5.3.1).
  - Observe all safety guidelines before undertaking conversions or modifications.
  - For repair and maintenance use only original replacement parts.

Warnings in the instruction manual which point out particular risks of personal injury or risk to the machine are marked with this symbol wherever applicable.

This symbol is a warning on the control and in the instruction manual. It indicates hazardous voltage.

**CAUTION** - In the case of failure this area can be current-carrying even after having turned the power off (non discharged capacitors).

- The drive is not an independently operating unit, but is designed to be incorporated into other machinery. It must not be put into service until the machinery into which it is to be incorporated has been declared in conformity with the provisions of the EC Directive.

**Save these instructions for future reference.**

## 2. Range of Applications

The drive is suitable for sewing machines:

Brand	
various brands	Industrial sewing machines Automatic sewing machines

### 2.1 Use in Accordance with Regulations

The drive is not an independently operating machine, but is designed to be incorporated other machinery. It must not be put into service until the machinery into which it is to be incorporated has been declared in conformity with the provisions of the EC Directive (Appendix II, paragraph B of the Directive 89/392//392/EEC and supplement 91/368/EEC).

The drive has been developed and manufactured in accordance with the respective EC standards:

EN 60204-3-1: 1990      Electrical equipment of industrial machines:  
Particular requirements for industrial sewing machines,  
sewing units and sewing systems.

The drive can only be operated:

- on thread processing machines
- in dry areas

---

## 3. Complete Drive Unit Consisting of

1	Direct current motor	DC....
1	Electronic control	vario dc AB85A4504
	- Power pack	N157
1	Position transmitter	P7-1
1	Set of standard accessories consisting of:	B131 belt guard, complete set of hardware motor mounting foot bracket 1 and 2, short documentation
1	Pulley	

### 3.1 Special Accessories

<b>Mains switch</b> type NS105	- available versions see mains switch specification
<b>Actuator</b> type EB301 cpl. with connecting cable, approx. 250 mm long and plug	- part no. 4160011
<b>Actuator</b> type EB301 cpl. (reduced actuating force) with connecting cable, approx. 250 mm long and plug	- part no. 4160012
<b>Actuator</b> type EB301 cpl. with connecting cable, approx. 750 mm long and plug	- part no. 4160016
<b>Actuator</b> type EB301 cpl. with connecting cable, approx. 1500 mm long and plug	- part no. 4160014
<b>Foot control</b> type FB302 for standing operation with approx. 1400 mm connecting cable and plug	- part no. 4160018
<b>Extension cable</b> for external actuator, approx. 750 mm long, complete with plug and socket connector	- part no. 1111845
<b>Extension cable</b> for external actuator, approx. 1500 mm long, complete with plug and socket connector	- part no. 1111787
<b>5-pin plug</b> (Mas 5100W) with locking screw for the connection of another external actuator	- part no. 0501278
<b>Potential equalization cord</b> 700 mm long, LIY 2.5 mm <sup>2</sup> , grey, with forked cable brackets on both sides	- part no. 1100313
<b>Extension cable</b> for position transmitter P7-..., approx. 1100 mm long, complete with plug and socket connector	- part no. 1100409
<b>Extension cable</b> for commutation transmitter, approx. 315 mm long complete with plug and socket connector	- part no. 1111229
<b>Extension cable</b> for commutation transmitter, approx. 1100 mm long complete with plug and socket connector	- part no. 1111584
<b>Extension cable</b> for motor connection, approx. 400 mm long	- part no. 1111858
<b>Extension cable</b> for motor connection, approx. 1500 mm long	- part no. 1111857
<b>Pulley</b> 40 mm $\phi$ with special belt intake and slip-off protection (use SPZ belt)	- part no. 1112223
<b>Pulley</b> 50 mm $\phi$ with special belt intake and slip-off protection (use SPZ belt)	- part no. 1112224
<b>Sewing light transformer</b>	- please indicate line voltage and sewing light voltage (6.3V or 12V)

### 4. Starting Service

Before putting the control into operation, the following must be ensured, checked and/or adjusted:

- **The correct installation of the drive, the position transmitter and accompanying devices, if necessary**
- **The correct adjustment of the direction of rotation of the motor**
- **The setting of the positions**

## 5. Socket Connectors

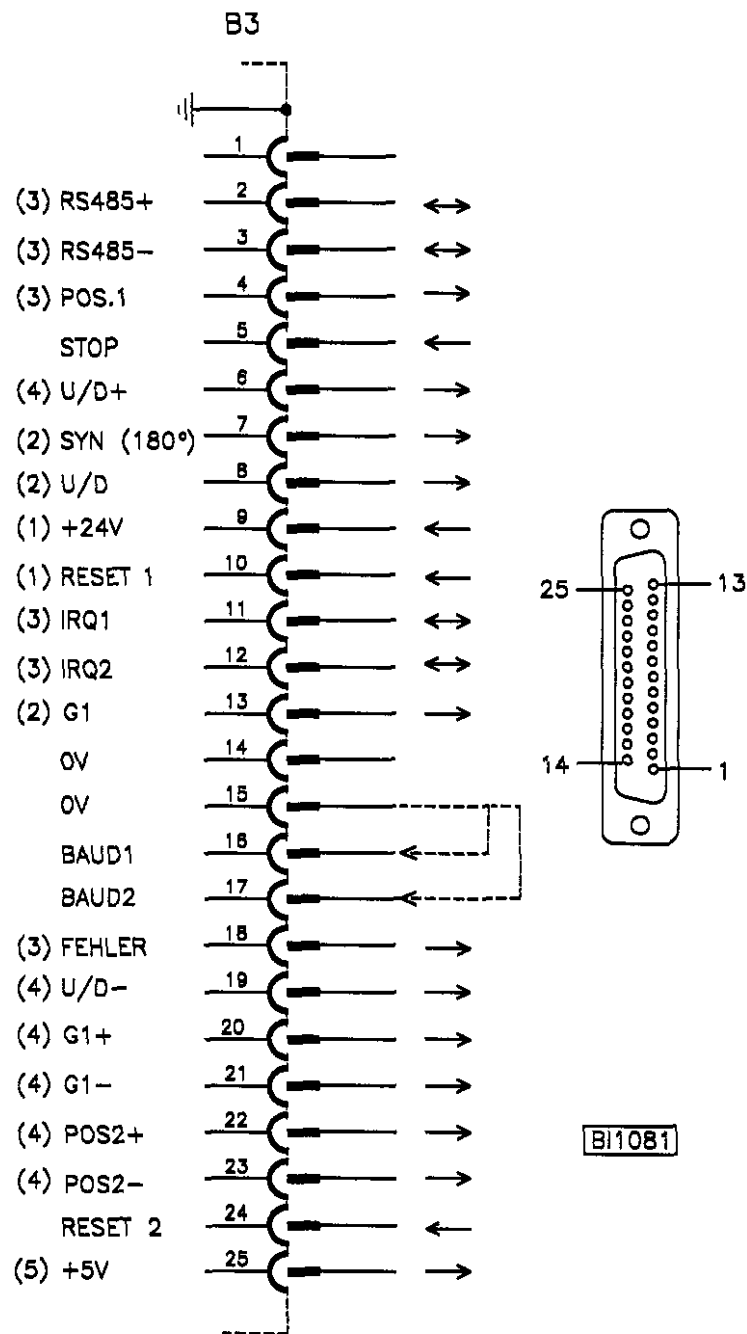

The drive receives the commands necessary for its operation from a master computer. A socket with an RS485 interface and further signal lines is provided for that. Moreover, the control has sockets for the connection of the motor, position transmitter and external actuator.

- B1 - Position transmitter P7-1
- B2 - Commutation transmitter for d.c. motor
- B3 - RS485 interface and further signal lines
- B80 - Actuator

## 6. Connection Diagram

For examples of connections see chapter 15 !

Symbols: --> = Output      <-- = Input      <--> = bidirectional

### Note:

Connecting cable between computer and control AB85A must be shielded.

- 1) RESET 1 in connection with external nominal voltage = 24V, no-load voltage = 36V
- 2) Output +5V, max. 15mA
- 3) TRI-STATE line (several slaves can be connected)
- 4) Differential driver outputs
- 5) Voltage +5V, I<sub>max</sub> = 200 mA

- |                 |  |
|-----------------|--|
| POS.1           | - Counting signal position 1   |
| POS.2+ / POS.2- | - Differential outputs position 2  |
| STOP            | - Input for the stop of the drive  |
| SYN             | - Synchronization window (180° track)  |
| U/D             | - Direction of rotation of the position transmitter<br>(counterclockwise = low / clockwise = high) |
| U/D+ / U/D-     | - Differential outputs of the direction of rotation of the position transmitter                    |
| RESET 1         | - Reset 1 (low active with U = < 11V)  |
| RESET 2         | - Reset 2 (low active with U = < 1.5V)   |
| IRQ1            | - Interrupt 1 (low active)   |
| IRQ2            | - Interrupt 2 (low active)   |
| G1              | - 512 impulses/rotation  |
| G1-/G1-         | - Differential outputs 512 impulses/rotation   |
| BAUD1           | - Input 1 to set baud rates  |
| BAUD2           | - Input 2 to set baud rates  |
| FEHLER          | - Error output   |

B11050

EB... - Actuator

## 7. Interface Definition

**Note:**

In the BUS system with an EFKA interface motor other modules (e.g. I/O) must have a smaller address than \$7F.

**Note:**

In the control a BUS termination resistor of 100 Ohm is provided. Therefore the control must be the last module to be connected to the RS485 BUS. If several controls are connected see chapter "Examples of Connections".

### 7.1 Baud Rate Selection

Baud rate	Jumper in plug B3
125,000 Baud	All pins open
41,667 Baud	Connect pin 16 with pin 15 (0V)
31,250 Baud	Connect pin 17 with pin 15 (0V)
9,600 Baud	Connect pin 16 and 17 with pin 15 (0V)

## 7.2 Delay

If the maximum transfer rate is set there must be a delay of 120  $\mu$ s between each word transferred.

## 7.3 Protocol

- Data transfer according to ISO 1745
- Only the commands **data link establishment** and **information transfer** are permitted.
- The control is selected with **address \$F0** (preset value). If several controls are connected further addresses up to \$FF are permitted.
- Data transfer in **ASCII** (see also chapter **ASCII Data Transfer**)
- One word = 10 bit (1 start bit, 8 data bits, 1 stop bit, no parity bit)

## 7.4 Send Timeout before "NAK"

After detecting an error the "NAK" acknowledgment will only be sent after a "timeout". See the following table for the length of the "timeout" depending on the baud rate.

125.000 Baud	2 ms	Timeout
41.667 Baud	3 ms	Timeout
31.250 Baud	4 ms	Timeout
9.600 Baud	10 ms	Timeout

## 7.5 Byte to Byte Timeout

If, in a telegram, a "timeout" is exceeded from one word to the next, "NAK" will be sent. Simultaneously, bit 6 is set in the communication register (parameter 00). See the following table for the length of the "timeout" depending on the baud rate.

125.000 Baud	6 ms	Timeout
41.667 Baud	8 ms	Timeout
31.250 Baud	10 ms	Timeout
9.600 Baud	22 ms	Timeout

## 7.6 Communication Monitoring (System Values D, Group E)

A "timeout" for communication monitoring can be set by parameter E3. This "timeout" can be set at 10-millisecond steps within a range of 0 and 255 (max. 2.5 seconds). If, in this parameter, a value not equal to zero is inputted, there must always be an information transfer to or a data link establishment with the slave within the preset time. If the "timeout" is exceeded, the drive stops in position 2 and sets bit 6 in the communication register (parameter 00). The "timeout" starts with the next telegram after the data link establishment for parameter E3. It is possible to deactivate the monitoring by inputting the value zero in parameter E3 (preset value). Please note that the new value becomes effective only with the next telegram.

## 7.7 Control Characters

SOH	\$01	start of header
ADR	\$F0	address (can be set)
STX	\$02	start of text
ETX	\$03	end of text
ACK	\$06	acknowledge
NAK	\$15	not acknowledge
ENQ	\$05	enquiry
BCC		block check EXOR-linkage of ADR to ETX

## 7.8 Special Characters

=	\$3D	equals / value assignment
,	\$2C	information separator in list recall
.	\$2E	information separator

## 7.9 Data Link Establishment

Overriding control = Master, AB85A = Slave

Master transmits	-	SOH	ADR	STX	<u>Text</u>	ETX	BCC
Slave transmits	-	ADR	ACK			If telegram o.k.	
	-	ADR	NAK			In case of error	

Parameters in the control are modified by the data link establishment. The Text contains the modification information. The general form of a modification is: **Parameter = Value**  
The parameter number and the corresponding range are described in chapter **Parameters**.

## 7.10 Information Transfer

Master transmits	-	SOH	ADR	STX	<u>Text</u>	ENQ	
Slave transmits	-	SOH	ADR	STX	<u>Text</u>	ETX	BCC

The Master receives information on the control status by the information transfer. This information is sent in the form of status bytes. Only the parameter number is transmitted by the information transfer. More information on the status bytes are described in chapter **Parameters**.

## 7.11 Text

The Text contains all data for the modification of settings in the control AB85A, or to recall operational statuses. These settings and operational statuses are described in detail in chapter **Parameters**.

## 7.12 Stop Input

0 = Run / 1 = Stop

The start of the drive can be suppressed, or the running motor can be stopped immediately by the "stop" signal. The drive can only be restarted after a reset (hardware or software). The stop signal must be on for at least 10 ms.

## 7.13 Error Output

0 = ready for operation / 1 = error

The "error" signal is emitted whenever one of the following items applies:

- Hardware error
- Software error
- Position transmitter not connected or defective
- Commutation transmitter cord or frequency converter disturbed
- Line voltage too low
- Blocking, motor overstrained

## 8. Parameters

The parameters are divided into the following groups:

- Group 0 :**     **Status and Control Register**  
Contain information on the actual control status
- Group 1-4 :**   **Control Values**  
The control values correspond to the system values after power on. They can be modified online during the functional sequence.
- Group 5 - 7 :**   **System Values**  
The system values serve as basic settings which are rarely modified. These values can be programmed once and are saved after power off.  
**Attention: The system values cannot be modified during sewing.**
- Group E :**     **Operational statuses**  
The actual operational statuses can be read out here, e.g. actual count of the counter or actual speed.
- Group F :**     **Ratings**  
Contain information on the control, e.g. software status and module address.

<u>Group 0</u>		
Parameter 00 - Communication Byte		
Bit 0	= 1	In response to an information transfer a list of parameter settings is transmitted (see chapter ASCII Data Transfer)
Bit 1	= 0	Reserved (must always be 0)
Bit 2	= 1	Overflow in case of data link establishment (parameter value above or below setting range)
Bit 3	= 1	Access not permitted
Bit 4	= 1	Noise error during transmission
Bit 5	= x	Reserved
Bit 6	= 1	Time-out error during transmission
Bit 7	= 1	Block check error (BCC) during transmission

Bit 0 and 1 can be overwritten and read. All others can only be read.

Parameter 01 - Error Byte		
Bit 0	= 1	Hardware error
Bit 1	= 1	Software error
Bit 2	= 1	Position transmitter not connected or defective
Bit 3	= 1	Commutation transmitter cord or frequency converter disturbed
Bit 4	= 1	Line voltage too low
Bit 5	= 1	Blocking, motor overstrained
Bit 6	= 1	Parameter does not exist
Bit 7	= 1	Transfer is temporarily interrupted

Parameter 02 - Status Byte 1		
Bit 0	= 1	Motor at standstill
Bit 1	= 1	Speed has been reached
Bit 2	= 1	Position has been reached
Bit 3	= 1	Is in position 2
Bit 4	= 1	Is in position 1
Bit 5	= 1	Drive is ready ( after RESET )
Bit 6	= 1	Reference point is reached
Bit 7	= 1	Position transmitter synchronized

Parameter 03 - Status Byte 2		
Bit 0	= 1	Position 1E has been reached (E = leading)
Bit 1	= 1	Position 1A has been reached (A = trailing)
Bit 2	= 1	Position 2E has been reached
Bit 3	= 1	Position 2A has been reached
Bit 4	= 1	Position 3E has been reached
Bit 5	= 1	Position 3A has been reached
Bit 6	= 1	180 ° window has been reached
Bit 7	= 1	Reserved

Parameter 04 - Control Byte 1		
Bit 0	= 1	Triggers a software reset
Bit 1	= 1	Direction of rotation cw
Bit 3/2	= 00	Speed 1 (parameter 10)
	= 01	Speed 2 (parameter 11)
	= 10	Speed 30 (parameter 63)
	= 11	Speed 40 (parameter 64)
Bit 6 - 4	= 000	Motor is supposed to run
	= 001	Fast stop ( unpositioned)
	= 010	Stop in position 1
	= 011	Stop in position 2
	= 100	Stop in position 3
	= 111	Release the pedal
Bit 7	= 1	Go to reference point

Parameter 05 - Control Byte 2	
Bit 0 = 1	Single impulse of position 2
Bit 1 = 1	Double speed ( <b>attention:</b> speed has been increased in steps of 4 RPM. This does not apply to the positioning speed)
Bit 2 = 1	Disengage accurate positioning
Bit 3-4 = 00	Stop with pedal in position 0 -> unpositioned (preset)
= 01	Stop with pedal in position 0 -> position 1
= 10	Stop with pedal in position 0 -> position 2
= 11	Stop with pedal in position 0 -> position 3
Bit 5	Limit speed to the value set in parameter 64 (speed 40)
Bit 6-7	Reserved

Parameter 08 - Status Byte 3	
Bit 0 = 1	Pedal contact A closed
Bit 1 = 1	Pedal contact B closed
Bit 2 = 1	Pedal contact C closed
Bit 3 = 1	Pedal contact D closed
Bit 4 = 1	Pedal in position -2
Bit 5 = 1	Pedal in position -1
Bit 6 = 1	Pedal in off-position
Bit 7 = 1	Pedal pushed forward

Parameter 0F - Interrupt Control Byte	
Bit 0 = 1	Receive interrupt line 1 ( IRQ1 )
Bit 1 = 1	Transmit interrupt line 1
Bit 2 = 1	Receive interrupt line 2 ( IRQ2 )
Bit 3 = 1	Transmit interrupt line 2
Bit 5/4 = 00	IRQ1 Delay with counter 1 (parameter 4C)
= 01	IRQ1 Delay with counter 1, then with timer 1 (parameter 4D)
= 10	IRQ1 Delay with timer 1, then with counter 1
= 11	IRQ1 Delay with timer 1
Bit 7/6 = 00	IRQ2 Delay with counter 2 (parameter 4E)
= 01	IRQ2 Delay with counter 2, then with timer 2 (parameter 4F)
= 10	IRQ2 Delay with timer 2, then with counter 2
= 11	IRQ2 Delay with timer 2

The function of the interrupt control is described in chapter **Interrupt Control**.

Group 1 Control Values A	
Parameter 10 - Speed 01	Speed 1 at [2 RPM] (with control byte 2 bit 1 = 1, then [4 RPM])
Parameter 11 - Speed 02	Speed 2 at [2 RPM] (with control byte 2 bit 1 = 1, then [4 RPM])
Parameter 12 - Positioning speed	Positioning speed at [2 RPM]
Parameter 17 - Braking power	Braking power at standstill (value changeable from 0 to 30.) After RESET parameter 57 will be read as preset value
Parameter 18 - Ramp 1	Accelerating ramp [1/min x ms]
Parameter 19 - Ramp 2	Slowing down to intermediate speed [1/min x ms]
Parameter 1A - Ramp 3	Slowing down for positioning [1/min x ms]

Group 4 Control Values D	
Parameter 4C - Stitch counter IRQ1	Stitch delay for transmitting or receiving of interrupt line 1
Parameter 4D - Timer IRQ1	Time delay,for transmitting or receiving of interrupt line 1
Parameter 4E - Stitch counter IRQ2	Stitch delay for transmitting or receiving of interrupt line 2
Parameter 4E - Timer IRQ1	Time delay for transmitting or receiving of interrupt line 2

<u>Group 5</u> System Values A		
Parameter 50	- Position1E	Position 1 leading edge
Parameter 51	- Position1A	Position 1 trailing edge
Parameter 52	- Position1E	Position 2 leading edge
Parameter 53	- Position1A	Position 2 trailing edge
Parameter 54	- Position1E	Position 3 leading edge
Parameter 55	- Position1A	Position 3 trailing edge
Parameter 57	- Braking power	Preset value for braking power at standstill (preset value = 0; i.e. braking at standstill is not effective)
Parameter 58	- Ramp 1	Accelerating ramp Is transferred to ramp 1 in case of reset (parameter 18)
Parameter 59	- Ramp 2	Slowing down to intermediate speed Is transferred to ramp 2 in case of reset (parameter 19)
Parameter 5A	- Ramp 3	Slowing down for positioning Is transferred to ramp 3 in case of reset (parameter 1A)

<u>Group 6</u> System Values B		
Parameter 60 - Direction of rotation		Direction of rotation of the motor cw = 0, ccw = 1 Contents is transferred to the control byte in case of reset
Parameter 61 - Speed 10		Speed 10 at [2 RPM] (with control byte 2 bit 1 = 1, then [4 RPM] Is transferred to speed 1 in case of reset (parameter 10)
Parameter 62 - Speed 20		Speed 20 at [2 RPM] (with control byte 2 bit 1 = 1, then [4 RPM] Is transferred to speed 2 in case of reset (parameter 11)
Parameter 63 - Speed 30		Speed 30 at [2 RPM] (with control byte 2 bit 1 = 1, then [4 RPM]
Parameter 64 - Speed 40		Speed 40 at [2 RPM] (with control byte 2 bit 1 = 1, then [4 RPM]
Parameter 65 - Maximum speed		The speed is internally limited to this value
Parameter 66 - Positioning speed		Positioning speed at [2 RPM] Is transferred to positioning speed in case of reset (parameter 12)

<u>Group 7</u> System Values C		
Parameter 70 - P-divisor		Dividing factor P-controller for adapting the running behavior to the machine
Parameter 71 - I-divisor		Dividing factor P-controller for adapting the running behavior to the machine
Parameter 72 - Stop segment		Number of increments before stop position

<u>Group E</u> System Value D		
Parameter E0 - Actual count of counter		The actual count of the counter of the position transmitter can be read out. After a reset synchronization is necessary. Use command "go to reference point". Without synchronization a false value will be emitted.
Parameter E1 - Actual speed		The actual speed can be read out. It is emitted at 2/min. The value must thus be multiplied by 2.
Parameter E2 - Run-out stop segment		Number of increments after stop position
Parameter E3 - Communication monitoring		Timeout between the transfers. If the preset time is exceeded, the drive stops in position 2 and set s bit 6 in the communication byte (0 = function disengaged)

<u>Group F</u>	<u>Ratings</u>
Parameter F0 - Entry 1	2 bytes as for ex. serial number can be entered here
Parameter F1 - Entry 2	2 bytes as for ex. work site number can be entered here
Parameter F2 - Working hours	2-byte working hours
Parameter F3 - Entry 3	2 bytes as for ex. repair note can be entered here
Parameter FE - Software status	8-byte entry for software status
Parameter FF - Address	The control address AB85A is filed here (preset = F0)

## 8.1 Special Features

When setting the speeds (parameters 10, 11, 61, 62, 63 and 64), half the value must be transmitted, i.e. the value "2000" [2 RPM] must be transmitted for a requested speed of 4000 [1 RPM].

## 8.2 Bit Descriptions

### 8.2.1 "RDY" Bit 5 in Status Byte 1

The "ready bit" will not be set in case of the following errors:

0 = Error as described below / 1 = Ready for operation

Hardware error  
 Software error  
 Position transmitter not connected or defective  
 Commutation transmitter cord or frequency converter disturbed  
 Line voltage too low  
 Blocking, motor overstrained

### 8.2.2 "NPE" Bit 6 in Status Byte 1

This status bit will be set if the drive is within a window of +/- 8 increments around the reference point after the command "got to reference point". When leaving this range the bit will be erased. The drive goes to the reference point in conjunction with control byte 1 bit 7 and the positioning speed (parameter 12). In order to stop exactly at the reference point the positioning speed should be as low as possible.

### 8.2.3 "P1E, P1A, P2E, P2A, P3E, P3A" in Status Byte 2

The status bits "PxE" with increasing edge and "PxA" with falling edge will be set for the corresponding position. These bits are preserved until the next change of status of the respective position. Furthermore, the bits can be used to trigger an interrupt (synchronization with position...).

### 8.2.4 "PSYN" BIT 7 in Status Byte 1

This status bit is set after the position transmitter has been synchronized. Thus the value in parameter E0 as well as all other status signals of the positions are valid.

### 8.2.5 "P2T" Bit 0 in Control Byte 2

If this bit has been set, a single impulse (LOW-HIGH-LOW) is emitted at the output of position 2. This command will only be executed at standstill. After emission of this impulse or if the drive has not been stopped, the bit will be reset.

### 8.2.6 "2N" Bit 1 in Control Byte 2

If this bit is set, the speeds are doubled. The quadruple speed must now be transmitted. Internally the speed is limited to 10000 RPM. The positioning speed will not be doubled.

Control Byte 2 bit 1 = 0           => double speed  
Control Byte 2 bit 1 = 1           => quadruple speed

### 8.2.7 "ZSTP\_" Bit 2 in Control Byte 2

If this bit is set, accurate positioning is switched off. The drive stops out of the positioning speed (parameter 68).

### 8.2.8 "PNLIM" Bit 5 in Control Byte 2

At this setting the speed is limited if the pedal speed is higher. The pedal speed has priority if it is lower than this limit.

## 8.3 Functional Descriptions

### 8.3.1 Stop Segment Angle for Positioning (System Values C, Group 7)

By means of parameter 72 an angle can be set with which the stop point can be moved backward depending upon the set stop position. The positions (1E, 1A, 2E, 2A, 3E, 3A) will not be changed.

The preset value for parameter 72 is 0. The maximum value is 50 increments (e. g.  $50 \times 1.4^\circ = 71.1^\circ$ ) and can be changed in single increments. Transmission is done at 2 bytes.

### 8.3.2 Run-Out Angle for Positioning (System Values D, Group E)

By means of parameter E2 an angle can be set with which the stop point can be put moved forward depending upon the set stop position. The positions (1E, 1A, 2E, 2A, 3E, 3A) will not be changed.

The preset value for parameter E2 is 6. The maximum value is 25 increments and can be changed in single increments (i. e.  $25 \times 1.4^\circ = 35^\circ$ ). Transmission is done at 2 bytes.

### 8.3.3 Accurate Positioning

Accurate positioning is time optimal and reproducible. Ensure that the value of ramp 3 (the preset value in parameter 1A corresponds to the value in parameter 5A) is lower than the maximum braking ramp determined by the system (3 to 5 [1/min x ms] lower than the maximum value). In order to determine the maximum braking ramp the value of ramp 3 can be set at the maximum (255). The value for ramp 3 is the quotient of speed and braking time (in ms).

In the example the ramp is the quotient speed change / time.

$$4500 \text{ [1/min]} / 150 \text{ [ms]} = 30 \text{ [1/min x ms]}$$

8.4 Outline of Parameters

Values - Ranges - Preset (all specifications in hexadecimal form = \$xxx)

GROUP	NO	DESCRIPTION	MINIMUM	MAXIMUM	PRESET	STEP
1	10	Speed 1, 2 RPM	\$023	\$DAC	Speed01	1
1	11	Speed 2, 2 RPM	\$023	\$DAC	Speed02	1
1	12	Positioning speed	\$023	\$0FA	Parameter 68	1

0	0F	interrupt control byte	TIQ2	ZIQ2	TIQ1	ZIQ1	SIQ2	EIQ2	SIQ1	EIQ1

- BCC = Block check error
- TIM = Time-out error
- NOI = Noise error
- ZUG = Access not permitted
- BER = Overflow
- LST = List is transmitted
- XOF = Transfer interrupted
- PNV = Param. does not exist
- BLCK = Motor overstrained, blocked
- NETZ = Line voltage too low
- KOM = Commutation transmitter or cable defective
- POSG = Position transmitter or cable defective
- SOFT = Software error
- HARD = Hardware error
- PSYN = Position transmitter synchronized
- NPE = Reference point reached
- RDY = Drive is ready
- PO1 = Is in position 1
- PNLIM = Limited speed (when using pedal)
- PO2 = Is in position 2
- POE = Position reached
- DZE = Speed reached
- STP = Motor at standstill
- 180 = 180° window reached
- P3A = Position 3A reached
- P3E = Position 3E reached
- P2A = Position 2A reached
- P2E = Position 2E reached
- P1A = Position 1A reached
- P1E = Position 1E reached
- NPA = Got to reference point
- STP3 = Stop bit 3
- STP2 = Stop bit 2
- STP1 = Stop bit 1
- V2 = Speed bit 2
- V1 = Speed bit 1
- DRI = Direction of rotation
- RES = Software reset
- PDST1 = Pedal stop bit 1
- ZSTP = Disengage accurate stop
- 2N = Double speed
- P2T = Single impulse of position 2
- PED+ = Pedal pushed forward
- PED0 = Pedal in off-position
- PED-1 = Pedal position -1
- PED-2 = Pedal position -2
- PEDD = Pedal contact D closed
- PEDC = Pedal contact C closed
- PEDB = Pedal contact B closed
- PEDA = Pedal contact A closed
- TIQ2 = Timer bit IRQ2
- ZIQ2 = Counter bit IRQ2
- TIQ1 = Timer bit IRQ1
- ZIQ1 = Counter bit IRQ1
- SIQ2 = Transmit IRQ2
- EIQ2 = Receive IRQ2
- SIQ1 = Transmit IRQ1
- EIQ1 = Receive IRQ1
- PDST2 = Pedal stop bit 2

## 9. ASCII Data Transfer

The complete transfer of a protocol is done in ASCII.

**Example:** Parameter 61 = \$8CA = 2250 2 RPM (speed 10 = 4500 1 RPM)

ASCII value	of 6	= 54 decimal	= \$36 hexadecimal
	of 1	= 49 decimal	= \$31 hexadecimal
	of (=)	= 61 decimal	= \$3D hexadecimal
	of 8	= 56 decimal	= \$38 hexadecimal
	of C	= 67 decimal	= \$43 hexadecimal
	of A	= 65 decimal	= \$41 hexadecimal

The data link establishment for parameter 61 = \$8CA must therefore be as follows:

SOH	ADR	STX	(6	1	=	8	C	A)	ETX	BCC
\$01	\$F0	\$02	\$36	\$31	\$3D	\$38	\$43	\$41	\$03	\$F1

## 10. List Recall

All marginal conditions of each parameter can be queried by a list recall.

GROUP	NO	DESCRIPTION	BIT - 7	6	5	4	3	2	1	0
0	00	Communication byte	BCC	TIM	--	NOI	ZUG	BER	--	LST

The value of a parameter is transmitted back to the master by the information transfer.

**Example:**

Master transmits	SOH	ADR	STX	(Parameter no.)	ENQ	
Slave transmits	SOH	ADR	STX	(Parameter value)	ETX	BCC

If the bit **LST** is set at 1 in the communication byte before the information transfer, not only the value of the parameter but all marginal conditions are transmitted in the form of a list.

**Example:**

Master transmits	SOH	ADR	STX	(Communication byte = xxxxxx1)	ETX	BCC
Slave transmits	ADR	ACK	If telegram o.k.			
	ADR	NAK	In case of error			

Thus the bit **LST** is set at 1 in the communication byte.  
Then the Master requests an information transfer:

Master transmits	SOH	ADR	STX	(Parameter no.)	ENQ
Slave transmits	SOH	ADR	STX	(LIST)	ETX BCC

In response to an information transfer a list is always transmitted until the master resets the bit **LST** in the communication byte.

**LIST** means in this case:

Parameter = Value,Minimum,Maximum,Step,Preset,Access

The list values are divided by commas ( ASCII \$2C ) during transfer !

## 12. Examples for Serial Data Transfer

### 12.1 Power On

Before power on, ensure that the right baud rate was selected by jumpers in the plug.

After power on and/or restart, the control needs approx. 2 seconds to be ready for operation. This status is transmitted by means of **bit 5 in status byte 1**.

GROUP	NO	DESCRIPTION	BIT - 7	6	5	4	3	2	1	0
0	02	Status Byte 1	PSYN	NPE	RDY	PO1	PO2	POE	DZE	STP

<b>Example:</b>	<b>Query for readiness for operation after power on (information transfer parameter 2)</b>					
Master transmits	SOH	ADR	STX	(Param. 02)	ENQ	
Slave transmits	SOH	ADR	STX	(02 = value)	ETX	BCC
The master recognizes the readiness for operation from bit 5.						

### 12.2 Operation

**Example:** Sequence of the speed profile below

\* = Step

<b>Step 1</b>	Determine speed1 = 4000 [1 RPM]	Control value A	Parameter10 = 2000 [2 RPM]
Master Slave	SOH ADR	ADR ACK	STX (\$31 \$30 \$3D \$37 \$44 \$30) ETX BCC

### 11. Interrupt Control

Parameter 0F		- Interrupt Control Byte
Bit 0	= 1	Receive interrupt line 1 ( IRQ1 )
Bit 1	= 1	Transmit interrupt line 1
Bit 2	= 1	Receive interrupt line 2 ( IRQ2 )
Bit 3	= 1	Transmit interrupt line 2
Bit 5/4	= 00 = 01 = 10 = 11	IRQ1 Delay with counter 1 (parameter 4C) IRQ1 Delay with counter 1, then with timer 1 (parameter 4D) IRQ1 Delay with timer 1, then with counter 1 IRQ1 Delay with counter 1
Bit 7/6	= 00 = 01 = 10 = 11	IRQ2 Delay with counter 2 (parameter 4E) IRQ2 Delay with counter 2, then with timer 2 (parameter 4F) IRQ2 Delay with timer 2, then with counter 2 IRQ2 Delay with counter 2

If bits 0 - 3 of this control byte is set the next arriving command will be linked with the interrupt request.

**Example 1:** Interrupt Control Byte = 00110001 = bit 0 -receive interrupt line 1  
= bit 4/5 -delay with timer 1

In case of a subsequent data link transfer, e.g. in order to stop the drive in position 1, this command will be executed only if IRQ1 becomes active and after the delay with timer 1.

**Example 2:** Interrupt Control Byte = 11001000 = bit 3 -transmit interrupt line 2  
= bit 6/7 -delay with Timer 2

When an information transfer for a status byte is requested, the updating of a certain bit within the status byte is signalled by setting IRQ2 after the delay with timer 2.

An interrupt is triggered by the status modification of a bit in the status byte if it is selected in the following manner:

GROUP	NO	DESCRIPTION	BIT - 7	6	5	4	3	2	1	0
0	02	Status Byte 1	—	NPE	RDY	PO1	PO2	POE	DZE	STP

The interrupt is to be triggered, when the drive is in position 1. This is done by a data link establishment for the status byte bit 4. The master transmits the text "02 = 00010000" and hereby determines that an interrupt is to be triggered, when bit 4 changes from 0 to 1.

If an interrupt is to be triggered, when the drive is no longer in position 1, the master transmits the text "02 = 11101111". The interrupt is triggered, when bit 4 changes from 1 to 0.

**Note**  
Only one interrupt per line can be released by the master control.

The pulse length of an interrupt is 100 µs.

<b>Step 2</b>		<b>Drive is supposed to run. Setting by control byte 04</b>					
	No reset				Control Byte 04	bit0 - RES	= 0
	Determine direction of rotation					bit1 - DRI	= 0
	Select speed 1					bit2 - V1	= 0
	Motor is supposed to run					bit3 - V2	= 0
						bit4 - STP1	= 0
						bit5 - STP2	= 0
						bit6 - STP3	= 0
	Do not go to reference point					bit7 - NPA	= 0
Master	SOH	ADR	STX	(04 = 00)	ETX	BCC	
Slave	ADR	ACK					

**Drive runs at 4000 RPM**

<b>Step 3</b>		Determine speed1 = 1800 [1 RPM]			Control value A	Parameter10 = 900 [2 RPM]	
Master	SOH	ADR	STX	(\$31 \$30 \$3D \$33 \$38 \$34)	ETX	BCC	
Slave	ADR	ACK					

**Drive runs at 1800 RPM**

<b>Step 4</b>		Reduce acceleration			Control value A	Parameter18 = 10	
Master	SOH	ADR	STX	(\$31 \$38 \$3D \$30 \$41)	ETX	BCC	
Slave	ADR	ACK					

<b>Step 5</b>		Determine speed1 = 4000 [1 RPM]			Control value A	Parameter10 = 2000 [2 RPM]	
Master	SOH	ADR	STX	(\$31 \$30 \$3D \$37 \$44 \$30)	ETX	BCC	
Slave	ADR	ACK					

**The drive accelerates with flat edge to 4000 RPM**

<b>Step 6</b>		Reduce braking ramp 3			Control value A	Parameter1A = 10	
Master	SOH	ADR	STX	(\$31 \$41 \$3D \$30 \$41)	ETX	BCC	
Slave	ADR	ACK					

<b>Step 7</b>		<b>Drive is supposed to stop in position 1. Setting by control byte 04</b>					
	No reset				Control Byte 04	bit0 - RES	= 0
	Determine direction of rotation					bit1 - DRI	= 0
	Select speed 1					bit2 - V1	= 0
	Drive is supposed to stop in pos.1					bit3 - V2	= 0
						bit4 - STP1	= 0
						bit5 - STP2	= 1
						bit6 - STP3	= 0
	Do not go to reference point					bit7 - NPA	= 0
Master	SOH	ADR	STX	(04 = \$20)	ETX	BCC	
Slave	ADR	ACK					

The drive moves to position 1 while braking slightly and then stops.

<b>Step 8</b>	Determine speed1 = 1500 [1 RPM]		Control value A	Parameter10 = 750 [2 RPM]
Master Slave	SOH ADR	ADR ACK	STX	(\$31 \$30 \$3D \$32 \$45 \$45) ETX BCC

<b>Step 9</b>	Increase acceleration		Control value A	Parameter18 = 30
Master Slave	SOH ADR	ADR ACK	STX	(\$31 \$38 \$3D \$31 \$45) ETX BCC

<b>Step 10</b>	Increase braking ramp 3		Control value A	Parameter1A = 80
Master Slave	SOH ADR	ADR ACK	STX	(\$31 \$41 \$3D \$35 \$30) ETX BCC

<b>Step 11</b>	Drive is supposed to run to the opposite direction of rotation. Setting by control byte 04			
	No reset		Control Byte 04	bit0 - RES = 0
	Change direction of rotation			bit1 - DRI = 1
	Select speed 1			bit2 - V1 = 0
				bit3 - V2 = 0
	Drive is supposed to run			bit4 - STP1 = 0
				bit5 - STP2 = 0
				bit6 - STP3 = 0
	Do not go to reference point			bit7 - NPA = 0
Master Slave	SOH ADR	ADR ACK	STX	(\$30 \$34 \$3D \$30 \$32) ETX BCC

The drive runs to the opposite direction of rotation at 1500 RPM.

<b>Step 12</b>	Drive is supposed to stop in position 2. Setting by control byte 04			
	No reset		Control Byte 04	bit0 - RES = 0
	Change direction of rotation			bit1 - DRI = 1
	Select speed 1			bit2 - V1 = 0
				bit3 - V2 = 0
	Drive is supposed to stop in pos.2			bit4 - STP1 = 1
				bit5 - STP2 = 1
				bit6 - STP3 = 0
	Do not go to reference point			bit7 - NPA = 0
Master Slave	SOH ADR	ADR ACK	STX	(\$30 \$34 \$3D \$33 \$32) ETX BCC

<b>Step 13</b>	Query as to whether drive has reached the position. Query by status byte 02			
Master Slave	SOH SOH	ADR ADR	STX STX	(\$30 \$32) (\$30 \$32 \$3D \$xx \$xx) ENQ ETX BCC

The status can be evaluated by the master control.

The query of the status byte requires constant polling by the master.

In order to avoid this the slave must be required to signal by interrupt when the position is reached.

<b>Step A:</b>	Interrupt Timer IRQ1 - Set parameter 4D at 20ms			
Master Slave	SOH ADR	ADR ACK	STX	(\$34 \$44 \$3D \$31 \$34) ETX BCC

Example: Reaching the position is signalled by interrupt after a delay of 20 ms.

<b>Step B:</b>		<b>Provide interrupt line 1 for slave by interrupt control byte 0F.</b>																		
		No reception IRQ1										Interrupt Byte 0F	bit0 - EIQ1	= 0						
		Transmit on IRQ1											bit1 - SIQ1	= 1						
		No reception IRQ2											bit2 - EIQ2	= 0						
		No transmission IRQ2											bit3 - SIQ2	= 0						
		With delay IRQ1											bit4 - ZIQ1	= 1						
		Without delay IRQ2											bit5 - TIQ1	= 1						
													bit6 - ZIQ2	= 0						
													bit7 - TIQ2	= 0						
Master		SOH	ADR	STX									ETX	BCC						
Slave		ADR	ACK																	

<b>Step C:</b>		<b>Selection of bit 2 in the status byte 1 for triggering the interrupt, when position is reached</b>																		
Master		SOH	ADR	STX									ETX	BCC						
Slave		ADR	ACK																	

<b>Step D</b>		<b>Drive is supposed to stop in position 2. Setting by control byte 04</b>																		
		No reset										Control Byte 04	bit0 - RES	= 0						
		Change direction of rotation											bit1 - DRI	= 1						
		Select speed 1											bit2 - V1	= 0						
													bit3 - V2	= 0						
		Drive is supposed to stop in pos. 2											bit4 - STP1	= 1						
													bit5 - STP2	= 1						
													bit6 - STP3	= 0						
		Do not go to reference point											bit7 - NPA	= 0						
Master		SOH	ADR	STX									ETX	BCC						
Slave		ADR	ACK																	

When bit 2 in status byte1 changes from 0 to 1, the time  $IRQ1 = 20ms$  is started and the interrupt  $IRQ1$  is triggered by the slave.

The master can identify whether the position is reached without polling by receiving interrupt 1.

### 13. Position Settings

GROUP	NO	DESCRIPTION	MINIMUM	MAXIMUM	PRESET	STEP
5	50	Position1E	\$00	\$FF	\$80	1
5	51	Position1A	\$00	\$FF	\$8A	1
5	52	Position2E	\$00	\$FF	\$00	1
5	53	Position2A	\$00	\$FF	\$0A	1
5	54	Position3E	\$00	\$FF	\$C0	1
5	55	Position3A	\$00	\$FF	\$CA	1

GROUP	NO	DESCRIPTION	BIT - 7	6	5	4	3	2	1	0
0	02	Status Byte 1	PSYN	NPE	RDY	PO1	PO2	POE	DZE	STP
0	03	Status Byte 2	---	180	P3A	P3E	P2A	P2E	P1A	P1E
0	04	Control Byte	NPA	STP3	STP2	STP1	V2	V1	DRI	RES

- NPE = Reference point reached
- PO2 = Is in Position 2
- 180 = 180° window reached
- P3E = Position 3E reached
- P2E = Position 2E reached
- P1E = Position 1E reached
- NPA = Go to reference point
- STP2 = Stop bit 2

- PO1 = Is in position 1
- POE = Position reached
- P3A = Position 3A reached
- P2A = Position 2A reached
- P1A = Position 1A reached
- STP3 = Stop bit 3
- STP1 = Stop bit 1

### Position transmitter P7-1

\* = Marking

The angular positions necessary on the machine, e.g. needle down position or thread lever up position are stored in the control as incremental values. An increment corresponds to approx. 1.4 angular degrees.

There are markings on the position transmitter shaft and on the housing. When both markings are aligned, this position corresponds to the value 0 and/or to the reference position.

Starting from this reference position, 3 further positions per rotation can be programmed.

The positions are programmed by the following parameters.

Parameter 50 = Pos1E  
 Parameter 51 = Pos1A  
 Parameter 52 = Pos2E  
 Parameter 53 = Pos2A  
 Parameter 54 = Pos3E  
 Parameter 55 = Pos3A

The above figure shows how the programming of position values can be distributed during one rotation.

The range of the parameter values is 0-255 increments. Programming position 1E to the increment value = 120 must be done by parameter value = 60.

The control doubles the parameter values of the positions. At position 2E = 220, the value = 110 would have to be transferred.

The designation **xE** and/or **xA** signifies E = leading edge and A = trailing edge of the position. This designation was determined following a mechanical position transmitter. Reaching a position is therefore marked by **xE** and exiting a position by **xA**.

A stop command for positions 1 to 3 in the control byte always refers to the leading edge = **xE**.

The status " is in pos1 or is in pos2 " refers to the range between **xE** and **xA** !

From the reference point, the control recognizes whether the position transmitter is within a 180° window. The master can identify whether e. g. the needle bar is in the upward or downward phase.

#### Attention

If the motor is mounted differently, e.g. at a different angle or with gear, make sure that the parameter value is assigned correctly to the direction of rotation. Reset the positions if necessary.

## 14. Acoustic Signals

### 14.1 Acoustic Error Signals

**Note:**  
Whenever an error signal is emitted, the drive is made to stop. The error signal can be heard until the drive is turned off.

**ERROR 1: Position transmitter error**  
(1 short, 1 long signal)

- Position transmitter defective or not connected
- Position transmitter not mounted on the sewing machine shaft

**ERROR 2: Mains interruption**  
(2 short, 1 long signal)

- Brief interruption of the mains supply (up to approx. 2 sec.)
- Loading relay is not switched

**ERROR 3: Blocking control**  
(3 short, 1 long signal)

- Sewing machine shaft does not move despite motor activation
- Set speed is not reached

**ERROR 4: Processor breakdown (illegal opcode)**  
(4 short, 1 long signal)

- Microprocessor does not work properly
  - Disturbances from outside (e.g. sewing machine head not grounded, line voltage disturbed)
  - Hardware malfunction on the computer printed circuit board

**ERROR 5: Commutation transmitter error**  
(5 short, 1 long signal)

- Commutation transmitter defective

### 14.2 Acoustic Signals of the Module Address

If the pedal is not in position zero (neutral), when switching power on, the module address is emitted. The leading hexadecimal digit "F" is suppressed. At the preset address "F0" only a long beep is emitted after a long pause. At every other address the second hexadecimal digit determines the number of short beeps, e.g. "F3": 3 short beeps, pause, long beep, long pause. The phases of the error signals are considerably shorter.

### 15. Examples of Connections

**Attention**  
Use shielded cables only.

#### 15.1 Reset with External 24V Supply

#### 15.2 Reset with Optocoupler

### 15.3 TRI-STATE Signals IRQ1 and IRQ2

(See also software agreements in chapter "Parameters"!)

### 15.4 Signals U/D, STOP, SYN and G1

### 15.5 OPEN COLLECTOR Signals POS1 and ERROR

\*1 = Further modules can be connected here!

### 15.6 Differential Signal Link

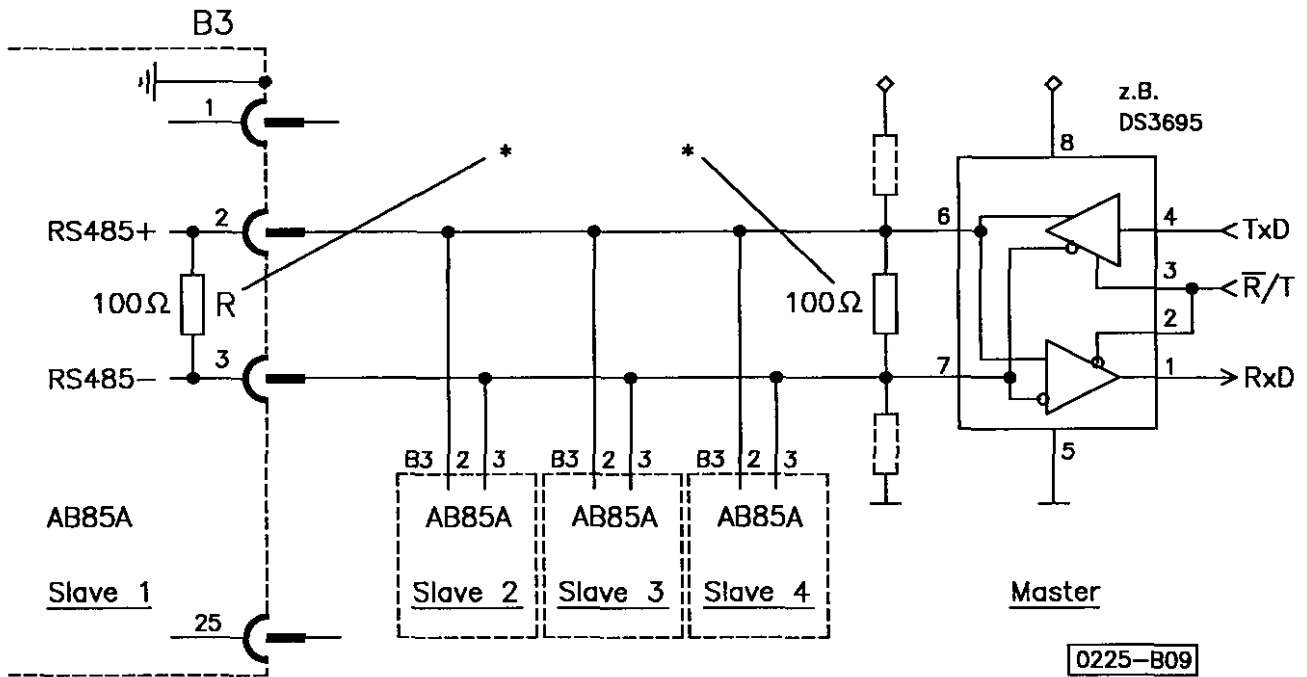

- G1 = Generator 512 impulses / rotation
- POS2 = Position 2
- U/D = Clockwise/counterclockwise rotation

### 15.7 Data Transfer RS485 with One Drive

15.8 Data Transfer RS485 with Several Drives

\* = Terminating resistors

Remove the terminating resistors "R" on "slave 2, 3, 4" in the control AB85A ! Determine different addresses (max. 16) if several drives are connected.

15.9 Position of the Terminating Resistor in the Control

- Disconnect mains
- Remove control cover after loosening the screws
- Remove terminating resistor "R" on the printed circuit board (see illustration)
- Put cover on again and tighten the screws

**Attention!**  
Before removing the cover, turn power off and remove mains plug from outlet!
